

Upstream Scenario Modelling Framework

Business Validation

Findings from technical testing, SME review and stakeholder feedback

The validation framework approach

Executive Summary

The completed evidence supports the Scenario Modeller’s use for its intended portfolio-planning workflow. The framework reproduced trusted planning structures and profiles, executed controlled scenario operations, integrated manual data and replicated an established A&D case.

✓ PLAN BOOK ACTIVITY REPLICATION	Controlled Financial Entity-to-Case mappings and scenario selection reproduced the required Plan Book-aligned oil and gas activity cut.	ACHIEVED
✓ PLAN BOOK METRIC ALIGNMENT	Cash Capex and Cash Costs aligned throughout 2026–2035. Production and Post-tax Cash Flow were substantially aligned, with limited and understood variation.	ACHIEVED
✓ OPERATIONS TESTING	Seven valid configurations produced the expected transformation, while six invalid configurations returned the expected Home-page validation response.	13 OF 13 PASSED
✓ MANUAL-DATA INTEGRATION	All 20 anonymised manual templates flowed through the controlled Teams location and semantic model into the Scenario Modeller.	20 OF 20 INGESTED
✓ A&D DILUTION REPLICATION	The modeller reproduced the same financial-profile impact as the established offline A&D dilution case using the equivalent cases, percentage and effective start year.	EXACT ALIGNMENT

4.0 / 5	NPS +67	3 of 3
All three respondents gave the same usability rating.	Forms-calculated overall-success NPS; directional result based on three responses.	Respondents supported further development.
	Targeted stakeholder survey: three respondents; findings are indicative.	

Evidence boundaries		
• The Plan Book comparison assessed four priority metrics rather than every case-by-year-by-metric combination. • Survey findings are indicative of a targeted three-person expert-user group. • The performance results relate to the current Python-in-Excel implementation and intended Plan Book-aligned workload.	• The testing does not assess enterprise characteristics such as concurrent users, service availability or production infrastructure resilience. • Detailed commercially sensitive profiles and graphical evidence remain in the approved Secret project location.	

Proceed with further development from the validated foundation

The evidence confirms business relevance, controlled execution and technical credibility. Further development should build on the existing modular architecture, extend analytical capability and consider additional processing or interface options as requirements evolve.

Success Criteria and Business Attestation Framework

The project will be evaluated across the following dimensions to assess both the technical performance of the prototype and the value it delivers to the wider planning process.

Evaluation dimension	Objective	Measure / evidence
Technical capability	Demonstrate that the prototype reliably performs the intended scenario modelling functions. Demonstrate analytical flexibility.	Successful execution of scenario operations, validated data pipeline, repeatable outputs and reconciliation to trusted planning artefacts. Ability to configure and compare multiple portfolio scenarios, including manual inputs, portfolio construction and optimisation capability.
Business value	Improve planning efficiency, repeatability and decision support.	Estimated reduction in manual effort, increased consistency of scenario construction and SME assessment of planning usefulness.
Governance and transparency	Demonstrate trusted and auditable analytical processes.	Documented assumptions, mappings, transformation rules, validation evidence, controlled manual inputs and security considerations.
Adoption and usability	Confirm that planners can understand, operate and challenge the prototype.	Walkthrough feedback, usability observations, review comments and enhancement requests.
Strategic contribution	Assess the prototype's contribution beyond the immediate use case.	Evidence of reusable architecture, lessons learned and contribution to wider initiatives (e.g. Horizon 3).
Sustainability	Assess whether the approach can be maintained, extended or scaled.	Recommendations for future development, known limitations and suitability for tactical or enterprise implementation.

Plan Book Replication

Can the modeler, together with the Financial Entity-to-Modelling Case translation input schedule, generate a portfolio activity cut that replicates the Plan Book representation used today?

Finance

Plan Book Replication – Activity Alignment

Can the framework translate financial entities into the same business-facing activity cut used in the Plan Book?

METHOD

MAP

Review the Plan Book structure and assign each financial entity to the appropriate region, country or individual modelling case.

OVERRIDE

Use controlled case-name overrides where financial-entity metadata does not match the business-friendly activity name used in the Plan Book.

SELECT

Configure Scenario 1 to include Main Plan and selected Option cases using No Change.

Unselected SAP options, demonstration-only manual cases, Archaea and Global Gas were excluded to match the selected Plan Book cut.

INTERPRETATION

- Business-facing modelling cases can be created from governed financial-entity metadata using transparent aggregation and override rules.
- Scenario configuration can reproduce the selected planning population without changing the underlying source profiles.

BG Overview			

Activity replication achieved

The framework recreated the required Plan Book-aligned activity cut while retaining traceability to the underlying financial entities and controlled mapping rules.

Plan Book Replication – Metric Alignment

Can the framework reproduce the shape of the key planning metrics presented in the 2026 O&G LTP Frame?

COMPARISON BASIS

- 1

CONFIGURE
Use the replicated Plan Book activity cut in Scenario 1, with No Change applied to all included cases.
- 2

COMPARE
Compare Scenario Modeller outputs with Ale's 2026 O&G LTP Frame across 2026–2035.
- 3

ASSESS
Review annual profile alignment for Cash Capex, Production, Cash Costs and Post-tax Cash Flow.

This was a focused profile comparison of four priority metrics, not a complete case-by-year-by-metric reconciliation of every Plan Book output.

INTERPRETATION

- All four priority metrics reproduced the expected overall annual profile shape.
- The limited differences were confined to identified years and explained by timing granularity or minor later-year variation.

METRIC PROFILE COMPARISON

METRIC	RESULT	COMPARISON FINDING
Cash Capex	✓ Aligned	Annual profile aligned throughout 2026–2035.
Production	✓ Substantially aligned	Aligned through 2032, with minor variation from 2033–2035.
Cash Costs	✓ Aligned	Annual profile aligned throughout 2026–2035.
Post-tax Cash Flow	✓ Substantially aligned	Slight variation in 2026 and 2027, driven by the Plan Book’s quarterly phasing compared with annual processing in the Scenario Modeller. Aligned from 2028 onward.

Detailed Plan Book and Modeller graph comparisons are retained in the approved Secret project location and are not reproduced in this pack.

Key metric replication achieved

The Scenario Modeller reproduced the annual profile shape of all four priority metrics across 2026–2035. Cash Capex and Cash Costs aligned throughout, while Production and Post-tax Cash Flow were substantially aligned with limited, understood variation.

Operations Testing

Do valid instructions flow through the calculation engine, while invalid instructions stop processing and return a clear error message to the Home page?

Finance

■ What is an operation?

DEFINITION

An operation is a controlled modelling instruction applied to a case profile.

It changes timing, scale, production, cost, CAPEX or transaction assumptions — without manually rebuilding the source profile.

Same source data, applied consistently — no manual profile rebuild.

Operations Testing – Results Overview

Do valid instructions flow through the calculation engine, while invalid instructions stop processing and return a clear error message to the Home page?

TEST METHOD

- 1

ANONYMISED INPUT PROFILES
Load anonymised profiles through the controlled manual-data pathway.
- 2

CONFIGURE OPERATION
Apply the operation to a case using a valid or deliberately invalid entry.
- 3

RUN ENGINE
Execute the scenario run and observe how the engine responds.
- 4

VERIFY OUTPUT OR ERROR
Review the output, or the Home-page error message, against expected behaviour.

Seven operations were assessed through 13 controlled runs: seven expected-success configurations and six expected-error configurations.

TEST OUTCOMES

OPERATION	EXPECTED-SUCCESS TEST	EXPECTED-ERROR TEST	OUTCOME
No Change	Run case as-is	Not applicable	✔ Case passed through unchanged
Delay	Delay by 2 years with a \$100m penalty in 2027	Enter -2 years; the function requires a positive integer	✔ Expected transformation confirmed ✔ Expected error returned
Accelerate	Accelerate by 2 years with \$100m funding in 2027	Enter 2.5 years; the function requires an integer	✔ Expected transformation confirmed ✔ Expected error returned
Farm-in	Increase by 25% from 2028–2035	Reverse the start and end years; start year must precede end year	✔ Expected transformation confirmed ✔ Expected error returned
Farm-down	Decrease by 25% from 2028–2035	Enter 120%; dilution percentage must not exceed 100%	✔ Expected transformation confirmed ✔ Expected error returned
Production Change	Increase by 25% from 2028–2035	Reverse the start and end years; start year must precede end year	✔ Expected transformation confirmed ✔ Expected error returned
Cost Change	Add \$100m in 2030	Remove the year input; each value requires a corresponding year	✔ Expected transformation confirmed ✔ Expected error returned

The results confirm both sides of the operational control: the engine applies valid scenario instructions correctly and prevents invalid parameter combinations from being processed silently.

13/13
CONTROLLED RUNS

13 of 13 controlled runs produced the expected outcome

Valid configurations flowed through the engine and produced the expected profile behaviour. Deliberately invalid configurations stopped processing and returned a clear validation message to the Home page.

Operations Testing – Evidence Success Cases

Scenario configuration inputs – how the test case were configured in the scenario modelling framework

Case Information			Operation		Operation input 1			Operation Input 2			Operation Input 3

Operations Testing – Evidence Error Cases

Case 2: Setting delay years to -2 in delay operation inputs

✗ Scenario engine run failed.

Scenario S1 could not process 'Project Sandpiper ' (ID 2) using operation 'Delay'. Review the scenario configuration and run the engine again.

- Scenario: S1
- Case: Project Sandpiper (ID 2)
- Operation: Delay
- Error: Delay years must be zero or a positive whole number.

Case 5: Setting dilution percentage to 120% in farm-down operation inputs

✗ Scenario engine run failed.

Scenario S1 could not process 'Project Deepstone ' (ID 5) using operation 'Dilution'. Review the scenario configuration and run the engine again.

- Scenario: S1
- Case: Project Deepstone (ID 5)
- Operation: Dilution
- Error: Dilution percentage must be between 0 and 1 inclusive.

Case 3: Setting accelerate years to 2.5 in accelerate operation inputs

✗ Scenario engine run failed.

Scenario S1 could not process 'Project Frontier West ' (ID 3) using operation 'Accelerate'. Review the scenario configuration and run the engine again.

- Scenario: S1
- Case: Project Frontier West (ID 3)
- Operation: Accelerate
- Error: Acceleration years must be entered as a whole number.

Case 6: Swapping start and end year in production change operation inputs

✗ Scenario engine run failed.

Scenario S1 could not process 'Project Phoenix Recovery ' (ID 6) using operation 'ProdnAdj'. Review the scenario configuration and run the engine again.

- Scenario: S1
- Case: Project Phoenix Recovery (ID 6)
- Operation: ProdnAdj
- Error: Production adjustment start year cannot be after the end year.

Case 4: Swapping start and end year in farm-in operation inputs

✗ Scenario engine run failed.

Scenario S1 could not process 'Project Crimson Basin ' (ID 4) using operation 'Increase'. Review the scenario configuration and run the engine again.

- Scenario: S1
- Case: Project Crimson Basin (ID 4)
- Operation: Increase
- Error: Farm-in start year cannot be after the end year.

Case 7: Removing the year input in capex change operation inputs

✗ Scenario engine run failed.

Scenario S1 could not process 'Project Neptune Expansion ' (ID 7) using operation 'CapexAbsolute'. Review the scenario configuration and run the engine again.

- Scenario: S1
- Case: Project Neptune Expansion (ID 7)
- Operation: CapexAbsolute
- Error: Each CAPEX adjustment requires both an adjustment amount and an adjustment year.

Manual Input Integration

Can standardised manual profiles be stored securely,
ingested through the semantic model and made available
correctly within the Scenario Modeller?

Finance

Manual Input Integration

Can standardised manual profiles be stored securely, ingested through the semantic model and made available correctly within the Scenario Modeller?

STANDARDISED INPUT

Anonymised profile data entered through the controlled manual-input template.

The schedule captures required case metadata and annual financial-profile values in a consistent structure.

[illegible]

Secure Teams location

 SECURE STORAGE

20 completed templates stored in the controlled Teams project site.

The files were collected through the governed data pathway and ingested into the Power BI semantic model

Scenario Name

Description

Last Updated

Configured By

All data for testing

Configure a scenario by selecting planning cases to **include** or **exclude** and applying operations that modify **timing**, **scale** or **input values** to evaluate alternative outcomes.

Case Information

Case name, Segment, Region, Country reference data and current Plan Type

Case ID	Case Name	Segment	Region	Country	Plan Type
1	Project Golden Dune	G&LC	Asia Pacific	ASpAc - Australia	Manual
2	Project Sandpiper	G&LC	India	India	Manual
3	Project Frontier West	G&LC	MENA - G&LCE	North Africa - Egypt	Manual
4	Project Crimson Basin	G&LC	Trinidad	Trinidad	Manual
5	Project Deepstone	P&O	AGT	AGT - Azerbaijan	Manual
6	Project Phoenix Recovery	P&O	BPX Energy	BPX	Manual
7	Project Neptune Expansion	P&O	Gulf of America and Canada	US - GoA	Manual
8	Project Falcon Ridge	P&O	Latin America	Argentina	Manual
9	Project Northern Horizon	P&O	MENA - OIL	Middle East - Iraq	Manual
10	Project Blackwater	P&O	North Sea	North Sea - UK	Manual

Manual-data integration achieved

All 20 anonymised manual templates were securely stored, ingested through the semantic model and returned successfully within the Scenario Modeller.

Manual-data integration test. Anonymised test profiles were used throughout; no live business data is shown.

A&D Dilution Replication

Can the framework recreate an existing A&D case that has previously been modelled offline as a dilution, avoiding the need to manually create a separate adjusted profile?

Finance

A&D Dilution Replication

Validation tested whether the same financial-profile impact could be produced without manually creating and loading a separate adjusted case.

SCREENSHOT 1 – CONFIGURATION

The equivalent cases were brought together in the modeller and configured using the required dilution percentage and effective start year.

A&D Case Replicated Exactly

Test passed: the modeller reproduced the same financial-profile impact as the established offline A&D case.

The result demonstrates that the dilution can be generated directly from the underlying asset cases, avoiding the need to manually create, load and maintain a separate adjusted profile.

SCREENSHOT 2 – OUTPUT COMPARISON

		(1,618)	(1,119)	(717)	(344)	(65)	(206)	(193)	(42)	(98)	(70)	(16)	(121)	(164)	(4,772)	

The model-generated profile aligned exactly with the existing A&D financial-entity profile created through the offline method and loaded through SAP.

- Repeatability** – Controlled percentage and effective-year inputs
- Consistency** – Aligned with the established A&D case
- Traceability** – Adjustment linked to selected underlying cases
- Efficiency** – Removes separate offline profile preparation

Stakeholder Survey

Does structured feedback from users and stakeholders support the expected benefits around effort reduction, consistency, traceability, usability, governance, and decision support?

Finance

Stakeholder evidence at a glance

Headline scores, expected effort saving, output validation, support for further development and the benefits respondents recognised.

NPS +67

Overall-success NPS

Promoters 2 | Passives 1 | Detractors 0

4.0 / 5

Usability rating

All three respondents rated usability 4 out of 5

10–50%

Expected effort reduction

One respondent 10–25%, one 25–50%, one unsure

3 of 3

Support further development

Unanimous; no concerns or preconditions submitted

OUTPUT VALIDATION AND SUPPORT

3 of 3 Requested scenario changes represented successfully

2 + 1 Two rated outputs fully directionally consistent, one 'mostly'

3 of 3 Respondents supported further development

KEY BENEFITS DELIVERED (respondents selecting, of 3)

Better decision support

3

Faster scenario creation

3

Improved auditability

3

Better governance

3

Reduced spreadsheet risk

3

Reduced manual effort

2

Improved traceability

2

Improved reproducibility

1

Targeted survey of three respondents: positive across business value, usability and adoption – directional evidence rather than a statistically representative benchmark.

Stakeholder testing supported that the framework produced understandable and expected scenario outcomes

Questions 1–7 assessed the relevance of the respondent group, the perceived operation of the framework and its potential effect on modelling effort.

These questions establish whether feedback came from relevant users and whether the framework behaved as expected when applied to scenario-modelling requirements.

RESPONDENT CONTEXT

Roles represented

- PPM – 1
- Data & Analytics – 1
- Digital Transformation – 1

Previous scenario-modelling experience

- Yes – 2
- Some involvement – 1
- No – 0

The survey brought together complementary planning, analytical and transformation perspectives. All respondents had either direct scenario-modelling experience or some prior involvement.

EFFORT SAVING EXPECTED (Q7)

Expected reduction in scenario-preparation effort

FRAMEWORK ASSESSMENT (Q1–7)

This question tested whether the framework addressed its central design objectives across usability, efficiency, governance, traceability and decision support.

Responses were predominantly positive across all seven statements. The strongest evidence related to consistency, repeatability and traceability. Neutral responses on ease of scenario comparison and the balance between flexibility and governance indicate areas where further refinement may strengthen the user experience.

OUTPUT VALIDATION (Q4–5)

These questions tested business reasonableness: whether the modelled changes were represented correctly and whether the resulting profile direction aligned with stakeholder expectations.

Q4 Outputs directionally consistent with expectations

3 of 3

Confirmed requested changes were represented

All respondents confirmed that the requested scenario changes were represented successfully. Two considered the outputs fully directionally consistent and one selected 'Mostly'.

No responses were submitted to the optional explainability question (Q6); no conclusion has therefore been drawn from this item.

Stakeholder testing supports the functional validity of the framework: requested changes were represented successfully, outputs were directionally credible, and respondents generally recognised improved consistency, traceability and efficiency.

■ Respondents recognised broad business value and unanimously supported further development

Questions 8–15 assessed benefits, usability, overall success and priorities for the next stage.

These questions tested whether the prototype created relevant business value, was usable by its intended audience and provided sufficient evidence to justify continued development.

BENEFITS DELIVERED (Q8)

Benefits selected by respondents – tested whether the prototype delivered against the business problems it was designed to address.

The most consistently recognised benefits extended beyond speed. All respondents identified decision support, auditability, governance and spreadsheet-risk reduction, indicating that the perceived value lies in both analytical efficiency and stronger control.

"An excellent tool that takes a complex and highly specific processes that are currently executed manually, and brings them together into an automated and effective modelling framework."

Survey respondent

"Further enhancement to web-based application will completely eliminate the excel dependencies"

Survey respondent

4.0 / 5

Usability rating (Q9)
All three respondents rated
usability 4 out of 5

NPS +67

Forms-calculated overall-
success NPS

3 of 3

Support further development

NPS distribution – Promoters 2 | Passives 1 | Detractors 0. Based on three responses, treat as a directional stakeholder indicator rather than a statistically representative benchmark.

FUTURE-DEVELOPMENT PRIORITIES (RANKED)

- 1 Automation of scenario creation and comparison
- 2 Investment ratios such as NPV, IRR and related metrics
- 3 Governance, controls and auditability
- 4 Integration with existing planning data and tools
- 5 Automated scenarios through an optimisation engine
- 6 User experience and ease of use
- 7 Reporting and visualisation improvements
- 8 Other

Respondents prioritised deeper automation and investment-decision metrics while continuing to value governance and integration. The next stage should extend analytical capability without weakening control or traceability.

Support for further development was unanimous. No concerns or preconditions were submitted through the survey; this is not evidence that none exist.

The comments reinforce both sides of the conclusion: the prototype consolidates complex manual activity, while a future web-based implementation is seen as an opportunity to reduce the remaining Excel dependency.

The survey provides positive evidence across business value, usability and adoption: respondents recognised benefits in automation, governance and decision support, rated usability consistently at 4/5, produced a positive NPS of +67 and unanimously supported further development.

SME Walkthroughs

Summaries of the business and technical SME walkthrough sessions, covering key topics, questions raised, and feedback provided.

Finance

SME reviews confirmed the framework's business value and technical strength

Business and technical walkthroughs validated a governed, transparent and extensible scenario-modelling capability.

Business review: valuable, controlled and understandable

Business SME Walkthrough — 10 August 2026

WHAT WAS DEMONSTRATED

- Controlled translation from financial entities to modelling cases
- Governed manual inputs and configurable scenario operations
- Validation, error guidance and scenario-output analysis

KEY BUSINESS DISCUSSION

- Maintaining transparency while retaining essential SME judgement
- Governing source refreshes, manual inputs and scenario history
- Extending the operations library to future ownership-change requirements

WHAT WAS LEARNED

The review confirmed that the framework converts specialist scenario activity into a more transparent, repeatable and auditable workflow. Stakeholders understood the approach, recognised its value and identified relevant opportunities for continued enhancement.

“Wonderful application” — Business walkthrough participant

Technical review: governed, modular and extensible

Technical SME Walkthrough — 11 August 2026

WHAT WAS DEMONSTRATED

- Governed integration across enterprise data, Power BI, Excel and Python
- Modular scenario operations with structured validation and error handling
- Traceable execution, runtime logging and interactive output analysis

ARCHITECTURE EVOLUTION DISCUSSION

- ↑ Opportunity to move additional processing upstream as requirements and platform capability develop
- ↑ Opportunity to introduce alternative interfaces while retaining flexible Excel analysis

WHAT WAS LEARNED

The review confirmed that the current architecture provides a credible and effective foundation for the planning workflow. Its governed data integration, modular Python engine and familiar user interface support both current use and future extension.

BUSINESS VALUE CONFIRMED

- Stakeholders understood the workflow and recognised its relevance to portfolio planning.

CONTROLS DEMONSTRATED

- Governed inputs, explicit validation and traceable execution were evidenced.

EXTENSIBLE FOUNDATION

- The modular design supports additional operations, processing options and interfaces as requirements develop.

The SME reviews confirmed the framework as a credible, governed and extensible scenario-modelling capability that improves transparency, repeatability and control within the intended planning workflow.

Overall Evaluation and Recommendation

The evidence supports the Scenario Modelling Framework as a credible, governed, and extensible capability for the intended planning workflow

The Framework reproduced trusted planning structures and profiles, executed controlled operations, integrated manual data, and produced outputs that stakeholders could understand, review, and challenge.

Evaluation Dimension	Assessment	Evidence-Based Conclusion
Technical capability	✓ Supported	Plan Book replication, scenario-operation, manual-integration, A&D, and performance testing demonstrated controlled end-to-end execution.
Business value	✓ Supported	Validation reproduced established planning outcomes, while stakeholder and sponsor feedback identified benefits for decision support, transparency, and analytical agility.
Governance and transparency	✓ Supported	Controlled mappings, standardised inputs, visible assumptions, validation messages, and traceable execution strengthened the scenario-modelling process.
Adoption and usability	● Positive Evidence	The targeted survey recorded usability of 4.0/5.0, and all respondents supported further development; SME walkthroughs also provided positive usability feedback.
Strategic contribution	✓ Supported	Collaboration with Horizon X has extended learning from the Framework into wider portfolio-planning development and the EPM agenda.
Sustainability	◆ Extensible Foundation	The modular data layer and Python engine provide a maintainable basis for extending analytical methods and interfaces where future planning needs justify it.

Recommendation: continue development and live validation from the established foundation
